Haves ①

## I. Review:

A. Last time, we calculated the Quasilinear Equations

$$1. \left( \frac{\partial}{\partial t} + v_z \frac{\partial}{\partial z} \right) f_{s1} = \frac{q_s}{m_s} \frac{\partial \phi_1}{\partial z} \frac{\partial \langle f_s \rangle}{\partial v_z} \left. \vphantom{\left( \frac{\partial}{\partial t} + v_z \frac{\partial}{\partial z} \right)} \right\} \leftarrow \text{Fast evolution of Fluctuations}$$

$$2. \frac{\partial^2 \phi_1}{\partial z^2} = - \sum_s \frac{q_s}{\epsilon_0} \int_{-\infty}^{\infty} dv_z f_{s1}$$

$$3. \frac{\partial \langle f_s \rangle}{\partial t} = \frac{q_s}{m_s} \frac{\partial}{\partial v_z} \left\langle f_{s1} \frac{\partial \phi_1}{\partial z} \right\rangle \left. \vphantom{\frac{\partial \langle f_s \rangle}{\partial t}} \right\} \rightarrow \text{Slow evolution of Mean}$$

B. Fourier Transforms in Space & Time of  $\phi_1$  &  $f_{s1}$

$$1. \text{Space: } \phi_1(z, t) = \int_{-\infty}^{\infty} dk \tilde{\phi}_1(k, t) e^{ikz}$$

$$f_{s1}(z, v_z, t) = \int_{-\infty}^{\infty} dk \tilde{f}_{s1}(k, v_z, t) e^{ikz}$$

$$2. \text{Time: } \tilde{\phi}_1(k, t) = \hat{\phi}_1(k) e^{-i\omega(k, \tau) t}$$

$$\tilde{f}_{s1}(k, v_z, t) = \hat{f}_{s1}(k, v_z) e^{-i\omega(k, \tau) t}$$

where frequency  $\omega(k, \tau)$  may change on long timescale  $\tau \equiv t/\epsilon^2$

C. Reality Condition

$$1. \hat{\phi}_1(k) = \hat{\phi}_1^*(-k)$$

$$2. \omega_r(k, \tau) = -\omega_r(-k, \tau)$$

$$\gamma(k, \tau) = \gamma(-k, \tau)$$

## II. Derivation of Quasilinear Diffusion Equation (Unraveled)

A. Evolution of Mean Distribution

$$1. \frac{\partial \langle f_s \rangle}{\partial t} = \frac{q_s}{m_s} \frac{\partial}{\partial v_z} \left\langle f_{s1} \frac{\partial \phi_1}{\partial z} \right\rangle \rightarrow \text{Let's calculate this using solutions for } f_{s1} \text{ \& } \phi_1.$$

Lecture #21 (Continued)  
 II.A. (Continued)

HWes 2

$$\int_{\partial V_z} \left\langle f_{S1} \frac{\partial \phi_1}{\partial z} \right\rangle = \frac{\partial}{\partial z} \frac{1}{2L} \int_{-L}^L dz f_{S1} \frac{\partial \phi_1}{\partial z}$$

3. Substituting in Spatial Fourier Transform  $\tilde{f}_{S1}$  and  $\tilde{\phi}_1$ ,

$$= \frac{\partial}{\partial z} \frac{1}{2L} \int_{-L}^L dz \left[ \int_{-\infty}^{\infty} dk \tilde{f}_{S1}(k, v_z, t) e^{ikz} \right] \left[ \frac{\partial}{\partial z} \int_{-\infty}^{\infty} dk' \tilde{\phi}_1(k', t) e^{ik'z} \right]$$

4. Collecting all terms dependent on  $z$ :

$$= \frac{\partial}{\partial z} \int_{-\infty}^{\infty} dk \int_{-\infty}^{\infty} dk' \frac{ik'}{2L} \tilde{f}_{S1}(k, v_z, t) \tilde{\phi}_1(k', t) \left[ \int_{-L}^L dz e^{i(k+k')z} \right]$$

5. NOTE: Identity:  $\delta(x-x_0) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{i\omega(x-x_0)} d\omega$

Thus, in the limit of large box size  $L \rightarrow \infty$  (necessary for chosen boundary conditions), we have

$$\lim_{L \rightarrow \infty} \int_{-L}^L dz e^{i(k+k')z} = 2\pi \delta(k+k')$$

6. The  $\delta$ -function can be used to evaluate the  $k'$  integral at  $k' = -k$ :

$$= \frac{\partial}{\partial z} \int_{-\infty}^{\infty} dk \frac{2\pi}{2L} (-ik) \tilde{f}_{S1}(k, v_z, t) \tilde{\phi}_1(-k, t) = -\frac{\pi}{L} \frac{\partial}{\partial z} \int_{-\infty}^{\infty} dk ik \tilde{\phi}_1(-k, t) \tilde{f}_{S1}(k, v_z, t)$$

7. Now, let's substitute Time Fourier Transform  $\hat{\phi}_1$  &  $\hat{f}_{S1}$

$$a_1 = -\frac{\pi}{L} \frac{\partial}{\partial z} \int_{-\infty}^{\infty} dk ik \left[ \hat{\phi}_1(k) e^{-i\omega(k, t) +} \right] \left[ \hat{f}_{S1}(k, v_z) e^{-i\omega(k, t) +} \right]$$

Lecture #21 (Continued)

II. A.7. (Continued)

$$b. = -\frac{\pi}{L} \frac{\partial}{\partial v_z} \int_{-\infty}^{\infty} dk \ i k \hat{\phi}_1(-k) \hat{\psi}_{s1}(k, v_z) e^{-i[\omega(-k, \tau) + \omega(k, \tau)] + 2\delta(k, \tau) \tau}$$

8. NOTE:  $\omega(-k, \tau) + \omega(k, \tau) = -\omega_p(k, \tau) + i\delta(k, \tau) + \omega_p(k, \tau) + i\delta(k, \tau) = 2i\delta(k, \tau)$

9. Thus  $\frac{\partial}{\partial v_z} \left\langle \hat{\psi}_{s1} \frac{\partial \hat{\phi}_1}{\partial v_z} \right\rangle = -\frac{\pi}{L} \frac{\partial}{\partial v_z} \int_{-\infty}^{\infty} dk \ i k \hat{\phi}_1(-k) \hat{\psi}_{s1}(k, v_z) e^{+2\delta(k, \tau) \tau}$

10. Now, we'll substitute the solution for  $\hat{\psi}_{s1} = -\frac{q_s}{m_s} \frac{k \hat{\phi}_1(k)}{(\omega - kv_z)} \frac{\partial \langle \psi_s \rangle}{\partial v_z}$   
(see III C.3. & Lect #17) →

$$= + \frac{\pi q_s}{L m_s v_z} \int_{-\infty}^{\infty} dk \ i k^2 \frac{\hat{\phi}_1(-k) \hat{\phi}_1(k)}{\omega - kv_z} \frac{\partial \langle \psi_s \rangle}{\partial v_z} e^{2\delta(k, \tau) \tau}$$

NOTE: Does not depend on k.

11. We can use  $\hat{E}_1(k) = -ik \hat{\phi}_1(k)$  so eliminate  $\hat{\phi}_1$ :

$$= \frac{\pi}{L} \frac{q_s}{m_s} \frac{\partial}{\partial v_z} \left\{ \int_{-\infty}^{\infty} dk \ \frac{i \hat{E}_1(k) \hat{E}_1(-k)}{\omega - kv_z} e^{2\delta(k, \tau) \tau} \right\} \frac{\partial \langle \psi_s \rangle}{\partial v_z}$$

B. Writing in terms of Spectral Energy Density of Electric Field

(The Electrostatic energy density is given by

$$W_E = \frac{\epsilon_0 |E_1(z, t)|^2}{2}$$

a. Averaging this energy density gives  $\langle W_E \rangle = \frac{\epsilon_0}{4L} \int_{-L}^L dz |E_1(z, t)|^2$

## III B. (Continued)

2. We can write  $\langle W_E \rangle$  in terms of  $\tilde{E}_1(k, t)$  by

$$\begin{aligned} \langle W_E \rangle &= \frac{\epsilon_0}{4L} \int_{-L}^L dz \left[ \int_{-\infty}^{\infty} dk \tilde{E}_1(k, t) e^{ikz} \right] \left[ \int_{-\infty}^{\infty} dk' \tilde{E}_1^*(k', t) e^{-ik'z} \right] \\ &= \frac{\epsilon_0}{4L} \int_{-\infty}^{\infty} dk \int_{-\infty}^{\infty} dk' \tilde{E}_1(k, t) \tilde{E}_1^*(k', t) \int_{-L}^L dz e^{i(k-k')z} \\ &= \frac{\pi \epsilon_0}{2L} \int_{-\infty}^{\infty} dk \tilde{E}_1(k, t) \tilde{E}_1^*(k, t) \end{aligned}$$

$\int_{-L}^L dz e^{i(k-k')z} = 2\pi \delta(k-k')$

3. Thus

$$\langle W_E \rangle = \int_{-\infty}^{\infty} dk \mathcal{E}(k, t)$$

where we define the Spectral Energy Density  $\mathcal{E}(k, t) = \frac{\pi \epsilon_0}{2L} |\tilde{E}_1(k, t)|^2$

4. We may write the time dependence of  $\mathcal{E}(k, t)$  as

$$a. \mathcal{E}(k, t) = \frac{\pi \epsilon_0}{2L} |\hat{E}(k)|^2 e^{2\gamma(k, t) t}$$

b. This implies

$$\frac{d\mathcal{E}(k, t)}{dt} = 2\gamma(k, t) \mathcal{E}(k, t)$$

$\uparrow$   $\gamma$  is treated as a constant

## C. Putting it all together

$$1. \text{ We have } \left. \frac{\partial \langle P_s \rangle}{\partial t} = \frac{\pi q_s^2}{k m s^2} \frac{\partial}{\partial v_z} \left[ \int_{-\infty}^{\infty} dk \frac{i \frac{2k}{\pi \epsilon_0} \mathcal{E}(k, t)}{\omega - kv_z} \right] \frac{\partial \langle P_s \rangle}{\partial v_z} \right\}$$

$$\text{where we note } \hat{E}_1(k) \hat{E}_1(-k) = \hat{E}_1(k) \hat{E}_1^*(k) = |\hat{E}(k)|^2$$

## III C. (Continued)

2. Finally we obtain

$$\frac{\partial \langle f_s \rangle}{\partial t} = \frac{\partial}{\partial v_z} \left[ D_q(v_z, t) \frac{\partial \langle f_s \rangle}{\partial v_z} \right]$$

Quasilinear  
Diffusion Equation

where the Quasilinear Diffusion Coefficient is

$$D_q(v_z, t) = \frac{2}{\epsilon_0} \left( \frac{q_s}{m_s} \right)^2 \int_{-\infty}^{\infty} dk \frac{i \epsilon(k, t)}{\omega - kv_z}$$

## D. Reality of Quasilinear Diffusion Coefficient

NOTE:  $\frac{i \epsilon(k, t)}{\omega - kv_z} = \frac{i \epsilon(\omega_r - kv_z - i\gamma)}{(\omega_r - i\gamma - kv_z)(\omega_r - i\gamma - kv_z)}$

$$= \frac{i \epsilon(\omega_r - kv_z) + \epsilon \gamma}{(\omega_r - kv_z)^2 + \gamma^2}$$

2.  $\int_{-\infty}^{\infty} dk \frac{i \epsilon(k, t) \overbrace{(\omega_r - kv_z)}^{\text{odd}} + \overbrace{\epsilon(k, t) \gamma}^{\text{Even Even}}}{\underbrace{(\omega_r - kv_z)^2}_{(\text{odd})^2 = \text{even}} + \underbrace{\gamma^2}_{\text{even}}}$

a. Since first term is overall odd, it cancels on integration over  $\int_{-\infty}^{\infty} dk$ .

b. Thus, we are left with a real quantity:

$$D_q(k, t) = \frac{2}{\epsilon_0} \left( \frac{q_s}{m_s} \right)^2 \int_{-\infty}^{\infty} dk \frac{\epsilon(k, t) \gamma(k, t)}{(\omega_r(k, t) - kv_z)^2 + \gamma^2(k, t)}$$

### III. Application of Quasilinear Theory:

A. Initial System  $f_0(v_z)$

2. Three quantities must be evolved:
- $\langle f_s(v_z, \tau) \rangle$  Mean Distribution
  - $\mathcal{E}(k, t, \tau)$  Spectral Energy Density
  - $\gamma(k, \tau)$  Growth Rate

### 3. Evolution Equations:

$$a. \frac{\partial \langle f_s \rangle}{\partial \tau} = \frac{\partial}{\partial v_z} \left[ D_q(v_z, t, \tau) \frac{\partial \langle f_s \rangle}{\partial v_z} \right]$$

$$\text{where } D_q(v_z, t, \tau) = \frac{2}{\epsilon_0} \left( \frac{q_s}{m_s} \right)^2 \int_{-\infty}^{\infty} dk \frac{\mathcal{E}(k, t, \tau) \gamma(k, \tau)}{(\omega_r(k, \tau) - kv_z)^2 + \gamma(k, \tau)^2}$$

$$b. \frac{\partial \mathcal{E}(k, t, \tau)}{\partial t} = 2 \gamma(k, \tau) \mathcal{E}(k, t, \tau)$$

$$c. D(k, \omega) = 1 - \sum_s \frac{q_s^2 n_s^2}{k^2} \int_{-\infty}^{\infty} dv_z \frac{\frac{\partial \langle f_s \rangle}{\partial v_z}}{v_z - \frac{\omega}{k}} = 0$$

The solution of the dispersion relation yield  $\gamma(k, \tau)$  for unstable modes.

Thus,  $\langle f_s(v_z, \tau) \rangle$ ,  $\mathcal{E}(k, t, \tau)$ , and  $\gamma(k, \tau)$  must be advanced in time self-consistently.

II. (Continued)

B. The Bump-on-Tail Instability

1. Initial Distribution

2. Assume  $|\gamma| \ll |\omega_r|$

$\Rightarrow$  Weak Growth Rate:

3. Remember from Lec # 8 II.C.5., in the weak growth approximation,

$$a. \gamma = \pi \frac{k}{|k|} \frac{1}{\partial D_r / \partial \omega_r} \approx \frac{\omega_{ps}^2}{S} \frac{\partial f_{s0}}{\partial v_z} \Big|_{v_z = \frac{\omega_r}{k}}$$

b. Thus  $\gamma > 0$  only where  $\frac{\partial f_{s0}}{\partial v_z} > 0$  (for  $v_z > 0$ )

4. Since  $\frac{\partial \mathcal{E}(k, t, \tau)}{\partial t} = 2\gamma(k, \tau) \mathcal{E}(k, t, \tau)$ , the spectral energy density  $\mathcal{E}(k)$  only grows in this range of unstable waves with  $v_z = \frac{\omega}{k}$ .

5. a. For a small, unstable growth rate  $|\gamma| \ll |\omega_r|$ , we

can estimate  $\frac{\gamma}{(\omega_r - kv_z)^2 + \gamma^2} \approx \pi \delta(\omega_r - kv_z) = \frac{\pi}{v_z} \delta\left(\frac{\omega_r}{v_z} - k\right)$

2. We can thus evaluate  $D_q(v_z, t, \tau)$

$$D_q(v_z, t, \tau) = \frac{2}{\epsilon_0} \left(\frac{q_s}{m_s}\right)^2 \int_{-\infty}^{\infty} dk \mathcal{E}(k, t, \tau) \frac{\pi}{v_z} \delta\left(\frac{\omega_r}{v_z} - k\right) = \frac{2\pi \hat{f}_s^2}{\epsilon_0 (m_s)^2} \frac{\mathcal{E}(k = \frac{\omega_r}{v_z})}{v_z}$$

Diffusion due to resonant waves

# Lecture #21 (Continued)

Howes (8)

## III, B. (Continued)

6. Therefore

$$a. \frac{\partial \langle P_s \rangle}{\partial t}(v_z, \tau) = \frac{\partial}{\partial v_z} \left\{ \frac{2\pi (q_s)^2}{\epsilon_0 (m_s)^2} \sum_{k=\frac{\omega_r}{v_z}} \frac{\partial \langle P_s \rangle}{\partial v_z} \right\}$$

For each  $v_z$ , only <sup>unstable</sup> wave solutions of Dispersion relation with  $v_z = \frac{\omega_r}{k}$  lead to diffusion.

$$b. \text{The equation is of the form: } \frac{\partial f}{\partial t} = \frac{\partial}{\partial v_z} \left[ K \frac{\partial f}{\partial v_z} \right] \sim K \frac{\partial^2 f}{\partial v_z^2}$$

This diffusion in velocity space!

c. This diffusion serves to smooth out the distribution function in velocity space in regions where unstable waves exist, i.e.  $\frac{\partial f}{\partial v_z} > 0$ .

## 7. The Result

a. Since particles mass be conserved, area under curve must not change.

b. Since diffusion occurs only in regions where  $\frac{\partial \langle P_s \rangle}{\partial v_z} > 0$ , the effect of quasilinear diffusion is to evolve  $\langle P_s \rangle$  to a state where  $\frac{\partial \langle P_s \rangle}{\partial v_z} \leq 0$  everywhere (for  $v_z > 0$ )  $\Rightarrow$

c. At this point, you reach marginal stability, unstable waves are no longer generated, and quasilinear diffusion stops.
