

Outline

- Go over problem 7.1
- Hubble expansion
- Cosmic clocks

Hubble Expansion

- Galaxies are moving away with speed, v , proportional to distance, D ,

$$v = H_0 D$$

- $H_0 = 70 \text{ km/s/Mpc}$ = Hubble “constant” – not actually a constant.

Hubble Expansion

- Expansion appears the same to all observers – work out on board.
- Implies no center to expansion.
- Work out age of universe on board.

Cosmic Clocks

- It is useful to check cosmological age estimates using the ages of physical objects in the universe.
- These provide only lower bounds on the age of the universe
- White dwarf cooling
 - white dwarfs start at roughly the same temperature
 - coolest white dwarfs require ~ 10 Gyr to cool
- Ages of globular clusters
 - construct HR diagrams for old clusters
 - oldest are 10-15 Gyr
- Ratios of radioactive elements

Radiometric Dating

- Need some object that produces two isotopes of a radioactive element in a known or calculable ratio.
- Each isotope decays with its own half life.
- Measure current ratio of isotopes. Can calculate age of object from known half lives and known initial ratio.
- Work out on board.
- Best to pick isotopes with half life \sim age of object

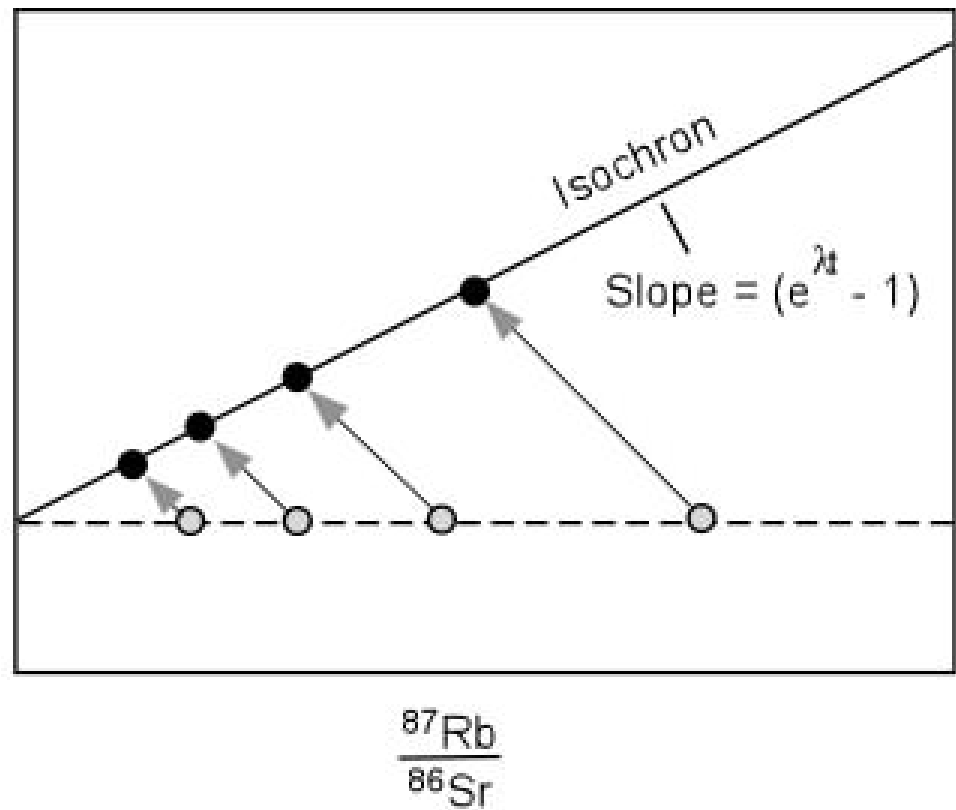

Radiometric Dating

- ^{235}U and ^{238}U
 - made in supernova, ratio ~ 1.2
 - current ratio on Earth, gives age of Earth or solar nebula
- ^{12}C and ^{14}C
 - found in fossils of organic matter
 - ^{12}C is stable ($1/\tau = 0$)
 - ^{14}C is made via cosmic ray interactions in atmosphere
 - assume initial ratio set by current atmospheric ratio

Isochron Plot

$$\frac{{}^{87}\text{Sr}}{{}^{86}\text{Sr}}$$

$$\left(\frac{{}^{87}\text{Sr}}{{}^{86}\text{Sr}}\right)_0$$

- ${}^{87}\text{Rb}$ decays to ${}^{87}\text{Sr}$, ${}^{86}\text{Sr}$ is stable
- ${}^{87}\text{Sr}$ and ${}^{86}\text{Sr}$ are chemically identical, so ${}^{87}\text{Sr}/{}^{86}\text{Sr} = \text{constant}$ within rock
- ${}^{87}\text{Rb}/{}^{86}\text{Sr}$ can vary from place to place
- as ${}^{87}\text{Rb}$ decays, ${}^{87}\text{Sr}$ builds up \rightarrow ${}^{87}\text{Sr}/{}^{86}\text{Sr}$ increases, ${}^{87}\text{Rb}/{}^{86}\text{Sr}$ decreases
- work out formula for slope

Homework

For next class: problem 7.2

- Why are there radial lines of galaxies in the position-redshift diagram below?
