

# Electric field lines

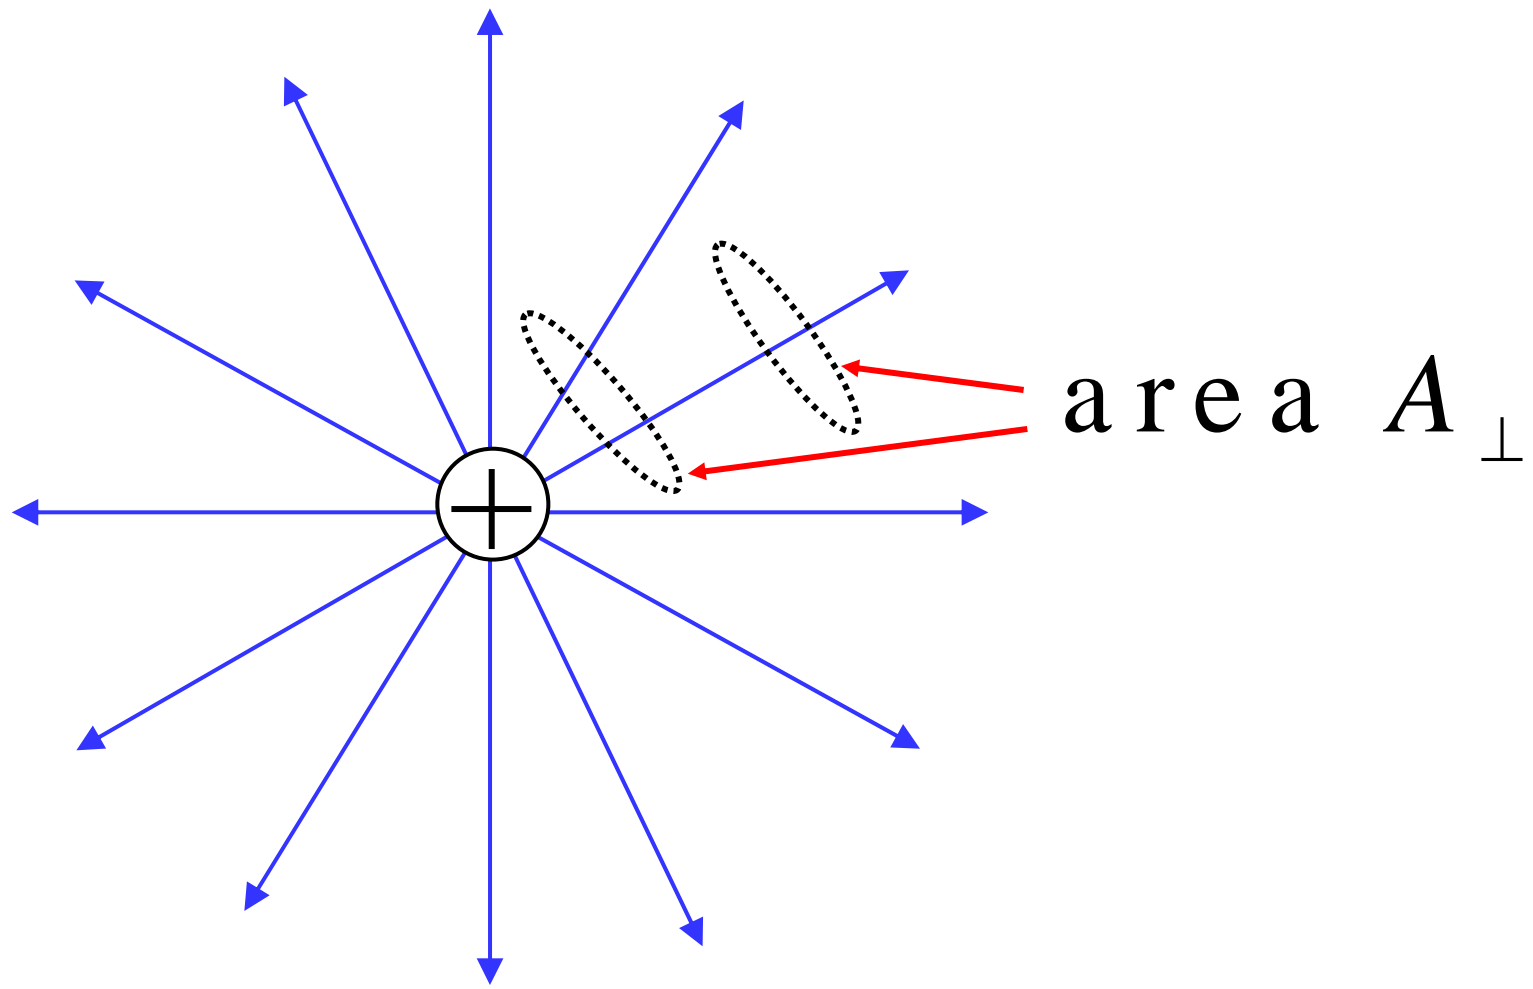

- The electric field is a VECTOR– specified at each point in space according to

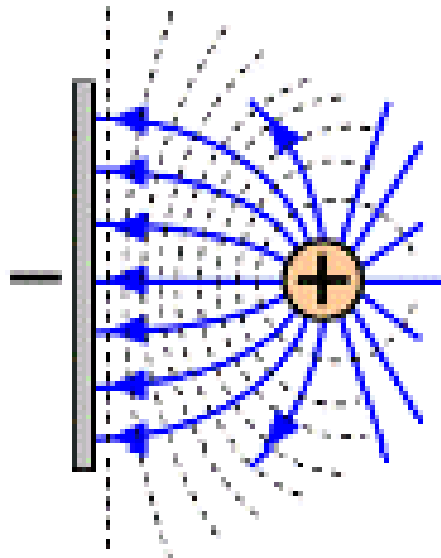

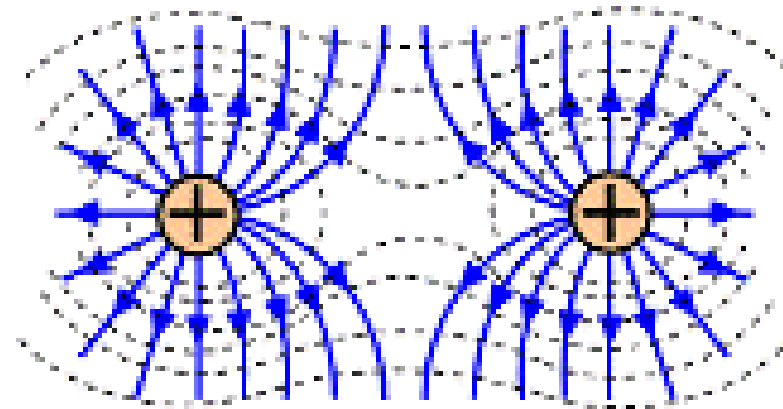

$$\vec{E}(\vec{r}) = \frac{1}{4\pi\epsilon_0} \int_V \frac{\rho(\vec{r}')}{|\vec{r} - \vec{r}'|^3} (\vec{r} - \vec{r}') d\tau'$$

- Electric field ‘lines’ is a concept introduced by Faraday to help us visualize the electric field
- *The field lines are not the same as the field*

# Rules for drawing field lines

- How many lines? Total number,  $N \propto Q$ 
  - start on a + and end on a – charge
  - start on a + and go out to  $\infty$
  - start at  $\infty$  and stop on a –
- Magnitude of  $E \propto$  the number of lines crossing a area perpendicular to  $E$  per unit area;  $E \propto N/A_{\perp}$ , so that  $\mathbf{E} \mathbf{A}_{\perp} \propto \mathbf{Q}$  (Gauss's Law)
- The electric field is everywhere **tangent** to the field lines
